MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or CC ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to CC 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and CC inhibits its expression; (2) a method of inhibiting the expression of CC mPGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mPGES-1. MPGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a chimeric antisense oligonucleotide crargeted to human microsomal prostaglandin 82 synthase (mpGBS-1). The human mpGBS-1 gene is located on chromosome 9, more specifically to CC having a sequence comprising 8-30 be targeted to a nucleic acid encoding mpGBS-1, which specifically hybridise with the nucleic acid encoding crafts its expression; (2) a method of inhibiting the expression of CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC mpGES-1 in cells or tissues, and (3) a method of treating an animal CC mpGES-1 in cells or tissues, and (3) a method of treating an animal CC mpGES-1 in cells or condition associated with mpGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, cantidabetic, immunomodulator, cardiant, neuroprotective, cantidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's contributed arthritis, diabetes, cancer, isbaemia or reperfusion injury, or ophthalmological, diabetes, cancer, isbaemia or reperfusion injury, or

CC human mpGES-1 gene is located on chromosome 9, more specifically to CC 934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chmeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense or condition associated with mpGES-1 condition associated with mpGES-1 condition, associated with mpGES-1 condition, associated with mpGES-1 condition, associated with mpGES-1 and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). Novel single or multiple target oligonucleotide anti-sense to e.g. CCR1, initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.

Claim 2; SEQ ID NO 1845; 174pp; English

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' end of a nucleic acid target cheef from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PD84 A, PD84 B, PD84 C or PD84 D. The invention CC also relates to a method of screening a candidate compound that binds to CC one or more nucleic acid target(s) or expressed product(s), for the CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PD84 B, PD84 C, or PD84 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with inflammatory disease. The respiratory or lung disease is considered with a respiratory or lung disease. from airway inflammation, allergy, asthma prosis (CF), chronic obstructive pulmonary , asthma, imp

                                                       The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDI (high density lipoprotein), elevated LDI (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, neurological disorders, or ischemia/reperfusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neuroprotective; vasotropic; antisense; gene therapy; Farnesoid X receptor; diabetes; immunological disorder; cardiovascular disorder; dyslighdemia; atheroscleries; in high density lipoprotein; low density lipoprotein; hypercholesterolemia; gallstones; hypertriglyceridemia; obesity; neurological disorder; ischemia; reperfusion; diagnostics; prophylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides useful for modulating expression of Farnesoid X Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                    CC 3' end does not contain seven or more bases that are perfectly matching CC except one mismatch to the 3' end sequence of the first primer or the second primer, the first primer at its 3' end does not contain six or CC more bases that are perfectly matching to a sequence anywhere of the CC does not contain eleven or more bases that rare perfectly matching except one mismatch to a sequence anywhere of the first primer at its 3' end CC does not contain eleven or more bases that are perfectly matching except one mismatch to a sequence anywhere of the first primer or the second CC primer. The method is useful for designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase CC chain reaction. It is also useful in the identification of multiple genes related to multifactorial diseases, the genome-scale detection of genetic alterations, the studies in pharmacogenetic reactions, the gene expression CC genetic polymorphisms in a large population, the gene expression the profiling in various samples and high throughput genetyping technologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The method comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end sequence of the first primer or a second primer, the first primer at its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction, for high throughput multiplex DNA sequence amplification, comprises aligning two primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          genetic alteration;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; primer; simultaneous ampurica single multiplex polymerase chain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   뭐
                                                                                                                                                         The invention describes a reagent (I) comprising a particle bound to at CC least one Raman label and a specific binding member, where the Raman CC label can be activated to provide a surface-enhanced Raman scattering CC (SERS) effect or comprising a specific binding member having two or more CC different Raman labels bound to it. Also described are: a test kit (II), CC comprising (I) in one container and a silver, gold or copper Raman CC enhancer stain in another container; and a fibre optic detection device (C (III), having a bundle of optical fibres terminating with ends of the optical fibre, where a several of the optical fibres have (I) located at the ends of the optical fibre. (I) is useful for: detecting for the CC presence or absence of one or more target analytes in a sample, the presence CC or absence of one or more target nucleic acid in a sample, the sequence or specific receptors. This sequence represents an oligonucleotide come come contained with the SERS-based detection analyte detection method.

                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a compound targeted to a nucleic acid molecule encoding B7H, where the compound specifically hybridises with the nucleic acid molecule encoding B7H and hibbit the expression of B7H. The compound is useful for modulating the expression of B7H. It is also useful for diagnosing or treating diseases associated with expression of B7H, e.g. an autoimmune disease. The present sequence represents a mouse
 cytostatic; antisense therapy; cytokine-inducible kinase; cytokine-inducible kinase inhibitor; antisense technology; cytokine-inducible kinase expression; hyperproliferative d antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compound targeted to a nucleic acid molecule encoding B7H and inhibits expression of B7H, useful for modulating the expression or for diagnosing or treating, e.g. autoimmune disease.

cells or tissues with the new compound so that the expression of Cytokine canducible kinase is inhibited; a method of screening for a modulator of Cytokine-inducible kinase; comprising contacting a preferred target compared to the nucleic acid encoding Cytokine-inducible kinase with one creatifying one or more candidate modulators of Cytokine-inducible kinase with one creatifying one or more modulators that modulate the expression of Cytokine-inducible kinase; and adjusted to the comprising a disease creatifying the presence of Cytokine-inducible kinase in a sample using at least one of the primers or probe comprising the compound; and a method of treating an animal device comprising the above compound; and a method of treating an animal compound a disease or condition associated with Cytokine-inducible kinase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of Cytokine-inducible kinase is inhibited. The antisense oligonucleotide is useful for inhibiting the expression of Cytokine-inducible kinase is inhibited. The antisense oligonucleotide is useful for inhibiting the cappression of Cytokine-inducible kinase is inhibited. The antisense oligonucleotide is useful for inhibiting the cappression of Cytokine-inducible kinase is cappression of Cytokine-inducible k
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a mediance of 2169 bp fully defined in the specification) and inhibits the expression of Cytokine-inducible kinase. Also described are: a method of inhibiting the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the Cytokine-inducible kinase in cells or tissues, comprising contacting the
                                                                                               treat diseases associated with the kinase expression, such as hyperproliferative disorders. In addition, the compound is used for disgnostics, prophylaxis, or as research reagents or kits. This sequence represents a human cytokine-inducible kinase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
The invention describes a compound 8-80 nucleobases in length targeted to CC a nucleic acid molecule encoding Cytokine-inducible kinase. The compound CC specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the specification) and inhibits the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the CC cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine-inducible kinase is inhibited; a method of screening for a modulator of Cytokine-inducible kinase, comprising contacting a preferred target compound to the nucleic acid encoding Cytokine-inducible kinase, and comprising contacting a preferred target component of the nucleic acid encoding Cytokine-inducible kinase, and component contacting a preferred target component contacting one or more modulators of Cytokine-inducible kinase, and component contacting and contacting a preferred target component contacting and contacting 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; antisense therapy; cytokine-inducible kinase; cytokine-inducible kinase inhibitor; antisense technology; cytokine-inducible kinase expression; hyperproliferative disorder; human; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified_base

The antisense oligonucleotide is useful for inhibiting the expression of Cytokine-inducible kinase in cells or tissues to prevent or treat diseases associated with the kinase expression, such as hyperproliferative disorders. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human cytokine-inducible kinase antisense oligonucleotide.
                            New compounds, particularly oligonucleotides targeted to a nucleic encoding kallikrein 6, useful for treating diseases associated with kallikrein 6, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             kallikrein 6; hyperproliferative disorder; kallikrein 6 exp

Example 15; SEQ ID NO 123; 56pp; English
```

The invention describes a compound 8-80 nucleobases in length targeted CC to, and which specifically hybridises with, a nucleic acid molecule cc encoding kallikrein 6, and inhibits the expression of kallikrein 6 in CC cells or tissues by contacting the cells or tissues with the compound so CC that expression of kallikrein 6 is inhibited; a method for screening a CC modulator of kallikrein 6 is inhibited; a method for screening a CC acid molecule encoding kallikrein 6 which one or more candidate modulators of kallikrein 6 is not identifying one or more modulators of kallikrein 6 cc expression which modulate the expression of kallikrein 6 kallikrein 6 cc expression which modulate the expression of kallikrein 6 kallikrein 6 cc expression which modulate the expression of kallikrein 6 in a sample using any of the primers or probes given in the cc specification; a kit or assay device comprising the compound; and a cc with by kallikrein 6 administering to the animal a therapeutic or CC prophylactic amount of the compound so that expression of kallikrein 6 is disease or condition associated with kallikrein 6, such as a cc inhibited. The compound, composition and methods are useful for treating to disease or condition associated with kallikrein 6, such as a cc inhibited for modulating the expression of kallikrein 6. This sequence cc represents a human kallikrein 6 antisense oligonucleotide. Sequence 20 BP; 2 A; 6 C; 8 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a compound 8-80 nucleobases in length targeted CC to, and which specifically hybridises with, a nucleic acid molecule ce encoding kallikrein 6, and inhibits the expression of kallikrein 6. Also described are: a method for inhibiting the expression of kallikrein 6 in CC cells or tissues by contacting the cells or tissues with the compound so compound the cells or tissues by contacting the cells or tissues with the compound so compound the cells or tissues with the compound so compound the cells of tissues with the compound so compound the cells of tissues with the compound so compound the cells of the cells or tissues with the compound so compound the cells of the cells of tissues with the compound so composition of kallikrein 6, and identifying one or more modulators of kallikrein 6 and identifying one or more modulators of kallikrein 6 cells of the cells of kallikrein 6 and identifying any of the primers or probes given in the specification, a kit or assay device comprising the compound; and a cells of the specification, a kit or assay device comprising the compound; and a cells of the presence of cells of treating an animal having a disease or condition associated cells of the compound; and a therapeutic or composition and methods are useful for treating cells of the presence of cells of the compound so that expression of kallikrein 6 is a disease or condition associated with kallikrein 6, such as a condition associated with kallikrein 6, such as a cells of the compound so the composition and methods are useful for treating cells of the composition of kallikrein 6. This sequence ceptages of the composition of kallikrein 6 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

They are also useful in research and CC diagnostics for modulating the expression of kallikrein 6. This sequence of compresents a human kallikrein 6 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                          밁

                                                                                                                            밁
                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                The invention describes a compound 8-80 nucleobases in length targeted CC to, and which specifically hybridises with, a nucleic acid molecule encoding kallikrein 6, and inhibits the expression of kallikrein 6. Also CC encoding kallikrein 6 in inhibits the expression of kallikrein 6 in CC calls or tissues by contacting the cells or tissues with the compound so that expression of kallikrein 6 is inhibited; a method for screening a CC modulator of kallikrein 6 by contacting a preferred segment of a nucleic acid molecule encoding kallikrein 6 with one or more candidate modulators (CC acid molecule encoding kallikrein 6 with one or more candidate modulators (CC expression which modulate the expression of kallikrein 6; a diagnostic method for identifying a disease state by identifying the presence of kallikrein 6 in a sample using any of the primers or probes given in the specification, a kit or assay device comprising the compound; and a cc method of treating an animal having a disease or condition associated with by kallikrein 6 administering to the animal a therapeutic or problylactic amount of the compound so that expression of kallikrein 6 is inhibited. The compound, composition and methods are useful for treating a disease or condition associated with kallikrein 6, such as a cc inhibited. The compound, composition and methods are useful for treating a disease or condition associated with kallikrein 6. This sequence crepresents a human kallikrein 6 antisense oligonucleotide.
                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                          specifically hybridises with a nucleic acid molecule encoding AP-2 alpha (1986 bp, SEQ ID NO: 4), and inhibits the expression of AP-2 alpha. Also described are:inhibiting the expression of AP-2 alpha in cells or tissues comprising contacting the cells or tissues with (I); screening for a modulator of AP-2 alpha by contacting a preferred target segment of a nucleic acid molecule encoding AP-2 alpha with one or more candidate modulators of AP-2 alpha, and identifying one or more candidate alpha expression, which modulate the expression of AP-2 alpha; a diagnostic method for identifying a disease state; and a kit or assay device comprising (I). The compound is useful for treating an animal having a disease or condition associated with AP-2 alpha, particularly a hyperproliferative disorder. The compounds may be used for diagnostics, therapeutics prophylaxis and as research reagents; or as tools in differential and/or combinatorial analyses to elucidate expression.
                                                                                                                                                                                 patterns of a portion or the entire complement of generals and tissues. This sequence represents a human AP-2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New compounds targeted to nucleic acid molecules encoding AP-2 alpha and inhibits the expression of AP-2 alpha, useful for treating AP-2 alpha-associated disease or condition, particularly a hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; AP-2-Inhibitor-Alpha; AP-2 alpha; AP-2 alpha modulator; AP-2 alpha associated disorder; hyperproliferative disorder; human; transcription factor; antisense oligonucleotide; antisense technology;
                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a compound (I) 8-80 nucleobases in length targeted to a nucleic acid molecule encoding AP-2 alpha. The compound

The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Ephrin-B2 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide trargeted to DNA encoding the human Ephrin-B2 polypeptide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targeted to a nucleic acid molecule encoding the human Ephrin-B2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Ephrin-B2 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Ephrin-B2 DNA antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; matrix metalloproteinase 11; MMP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human matrix metalloproteinase 11 DNA antisense oligonucleotide #3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADP27094;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide compound that inhibits expression of Ephrin-B2, useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                 10-DEC-2002; 2002US-00316755.
                                                                                                                                                                                                                                                                                                                                                                                            10-DEC-2002; 2002US-00316755.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         10-JUN-2004.

The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human MMP11 polypeptide of the invention.
                   The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMPII) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the MMPII polypeptide and in preparation of a composition for treating hyperproliferative disorders,
                                                                                                                                                                                                                                                                                             New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; matrix metalloproteinase 11; MMP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human MMP11 DNA antisense oligonucleotide target region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SXS
                       The invention relates to a method of detecting a nucleic acid with at cleast two portions by providing a type of nanoparticle-oligonuclectide conjugate, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with the two or more portions of the nucleic acid and observing a detectable change brought about by hybridisation. The oligonucleotides have a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the oligonucleotides on the nanoparticles with the nucleic acid results the oligonucleotides on the nanoparticles with the nucleic acid results in a detectable change. The method is used for detection and separation of nucleic acids (e.g. viral DNA, a gene associated with a disease, bacterial DNA, fungal DNA, synthetic DNA, structurally-modified DNA, DNA the sequencing, paternity testing and infections) and for forensies, DNA sequencing, paternity testing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SXS
The invention relates to a method of detecting a nucleic acid with at CC least two portions by providing a type of nanoparticle-oligonucleotide conjugate, contacting the nucleic acid and nanoparticles to allow CC chybridisation of the oligonucleotides with the two or more portions of the nucleic acid and observing a detectable change brought about by hybridisation. The oligonucleotides have a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the oligonucleotides on the nanoparticles with the nucleic acid results in a detectable change. The method is used for detection and separation of nucleic acids (e.g. viral DNA, a gene associated with a disease, cc bacterial DNA, fungal DNA, synthetic DNA, structurally-modified DNA, DNA from biological sources or PCR products) for diagnosis of various of diseases (such as genetic diseases, bacterial infections and viral cc infections) and for forensics, DNA sequencing, paternity testing and conitoring gene therapy. This sequence represents a linking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding NF-kappaB repressing factor (NRF). NF chappaB (nuclear factor kappaB) is involved in such cellular processes as the immune response, inflammatory response, oncogenesis, apoptosis, cell cycle, differentiation and cell migration. The compound (an antisense oligonucleotide) specifically hybridises with the nucleic acid molecule encoding NRF (which appears as ADP74371 and comprises nucleotides 469701 489000 of the X chromosome containing the NRF gene at Xq24-25) and
                                                                                                                                                                                                                                                   New antisense oligonucleotides for modulating expression, useful for diagnosing, preventing conditions involving an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oligonucleotide of the invention.

                                The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding NF-kappaB repressing factor (NRF). NF-kappaB (nuclear factor kappaB) is involved in such cellular processes as the immune response, inflammatory response, oncogenesis, apoptosis, cell cycle, differentiation and cell migration. The compound (an antisense eligonucleotide) specifically hybridises with the nucleic acid molecule encoding NRF (which appears as ADP74371 and comprises nucleotides 469701-489000 of the X chromosome containing the NRF gene at Xq24-25) and inhibits the expression of NRF. Also included are inhibiting the expression of NRF in cells or tissues, screening for a modulator of NRF, a diagnostic method for identifying a disease state, a kit or assay device comprising the above compound, and treating an animal having a disease comparising the above compound, and treating an animal having a disease comparising the above compound, and treating an animal having a disease comparising the solution of the compound of the comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibits the expression of NRF. Also included are inhibiting the expression of NRF in cells or tissues, screening for a modulator of NRF, a diagnostic method for identifying a disease state, a kit or assay device comprising the above compound, and treating an animal having a disease or condition associated with NRF. The antisense oligonucleotide is useful for inhibiting the expression of NRF in cells or tissues to prevent or treat diseases associated with aberrant NRF expression, such as diseases or conditions involving an immune response. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents of kits. The present sequence represents an antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating expression, useful for diagnosing, preventing conditions involving an immune response.
    device comprising the above compound, and disease or condition associated with NRF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2004-440344/41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-DEC-2002; 2002US-00317271.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chromosome Xq24-25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oncogenesis;

In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents an NRP genomic DNA target for the antisense oligonucleotides.
                                                                                New antisense oligonucleotides for modulating endothelial lipase expression, useful for diagnosing, preventing or treating diseases associated with aberrant endothelial lipase expression, e.g.

Also described are: inhibiting the expression of endothelial lipase in cells or tissues; screening for a modulator of endothelial lipase; a diagnostic method for identifying a disease state, a kit or assay device comprising the above compound; and treating an animal having a disease or condition associated with endothelial lipase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of endothelial lipase is inhibited. The antisense oligonucleotide is useful for inhibiting the expression of endothelial lipase in cells or tissues to prevent or treat diseases associated with aberrant endothelial lipase expression, such as cardiovascular disease. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human endothelial lipase expression of endothelial lipase expressions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense therapy; endothelial lipase; endothelial lipase associated disorder; cardiovascular disease; mouse; antisense oligonucleotide; antisense technology; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modified_base

expression, useful for diagnosing, preventing or treating diseases associated with aberrant endothelial lipase expression, e.g.
                                                                                     cardiovascular disease.
Example 16; SEQ ID NO 165; 114pp; English
```

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding endothelial lipase. The compound CC specifically hybridises with the nucleic acid molecule encoding ce endothelial lipase (which comprises a sequence of 3927 bp fully defined cc in the specification) and inhibits the expression of endothelial lipase. Also described are: inhibiting the expression of endothelial lipase in CC cells or tissues; screening for a modulator of endothelial lipase; a CC diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and treating an animal having a disease or CC condition associated with endothelial lipase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that cexpression of endothelial lipase is inhibited. The antisense conligonucleotide is useful for inhibiting the expression of endothelial collaborant endothelial lipase expression, such as cardiovascular disease. In addition, the compound is used for diagnostics, prophylaxis, or as creearch reagents or kits. This sequence represents a mouse endothelial lipase antisense oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            endothelial lipase (which comprises a sequence of 3927 bp fully defined in the specification) and inhibits the expression of endothelial lipase. Also described are: inhibiting the expression of endothelial lipase in cells or tissues; screening for a modulator of endothelial lipase; a diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and treating an animal having a disease or condition associated with endothelial lipase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of endothelial lipase is inhibited. The antisense oligonucleotide is useful for inhibiting the expression of endothelial lipase expression, such as cardiovascular disease. In addition, the compound is used for diagnostics, prophylaxis, or as integer to restrict the sequence represents a mouse endothelial lipase expression, such as cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating endothelial lipase expression, useful for diagnosing, preventing or treating diseases associated with aberrant endothelial lipase expression, e.g.

The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                            Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                   04-AUG-1995

```

A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse

                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files Aq75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                       Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                           Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            04-AUG-1995

                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mENAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mENAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate lanes.                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (CENESEQ files AAO75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                Reverse transcription primer used in cDNA analysis technique.

The method can be used to analyse gene expression rapidly and easily
A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of

                                                                        Query Match
                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (CENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

They were annealed and used in the construction DNA fragments (see also AAQ94978-80, AAQ94992, AAQ95004 and AAQ95006) that were inserted into vector pSK6 (see also AAR78323). The DNA fragments code for synthetic storage proteins (SSP8) contg. multiple lysine-rich heptad repeats (see AAR780239-41, AAR78239, AAR78238 and AAR78230. These can be expressed in the seeds of transformed plants, e.g. soybean and corn, to improve lysine content

dehydrogenase (GAPDH) gene, which was used as a control in a PCR reaction for detection of human papilloma virus and cellular sequences. Detection of mRNA contg. HPV and cellular sequences comprises: (a) isolating mRNA from an processed body sample; (b) converting to cDNA by using a reverse transcription primer (RTP); (c) amplification of cDNA by PCR with an HPV 5' primer and a 3' primer including a sequence of RTP; (d) cleaving amplified cDNA with an enzyme that cuts the 5' side of the HPV polyA signal; (e) amplification of uncleaved cDNA with the same primers as in (c) or with nested primers; and (f) detecting amplified DNA. The method is used for early diagnosis of carcinoma and high-grade dysplasia caused by HPV. Step (d) cleaves cDNA derived from episomal HPV but not that derived from HPV that has integrated into the genome. The method is very sensitive and selective and can detect a very small no. of HPV-infected cells. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             primers on e.g. blood or sputum samples. The method is useful for screening and monitoring tumours and metastases, e.g. small cell lung, cervical, colonic, hepatic, brain, breast or thyroid carcinomas. The present sequence is that of a probe which was used to detect amplified GAPDH sequences as a control in an experiment to amplify human papilloma virus HPV16 and HPV18 sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                            Primer oligo 4.1 (AAT35538) and primer oligo 4.2 (AAT35539) were designed using the known human DNase I mNNA sequence. They were used in the PCR amplification of human genomic DNA. A probe was generated and used to screen a human leukocyte DNA library. An isolated clone included a region (see also AAT35522) upstream of the known DNase I CDNA sequence, and a region (AAT35523) of the DNase I locus including exon 1, intron 1 and part of exon 2. Non-coding sequences of the DNase I locus can be used in gene constructs useful in the gene therapy of cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Altering expression of genes encoding thrombopoietin, DNase interferon - using DNA constructs useful in gene therapy to cystic fibrosis and multiple sclerosis.
